The most common way of computing numerical derivative of a function at any point is to approximate by some polynomial in the neighborhood of . It is expected that if selected neighborhood of is sufficiently small

then approximates near well and we can assume that .

Hi Pavel. Nice work. I'm using it now to compute the velocity of a robot (MBARS) and your methods give very good results. I'd like to know if you have the formula of a one-sided version, as using a centered version forces me to introduce a time lag.
