In gas chromatography (GC), the mobile phase is a inert gas (eg helium). The stationary stage is a thin layer of a inert fluid on an inert solid support -, for example, beads of silica pressed into a long thin tube (this adaptable tube is curled ordinarily inside a thermostatically-controlled oven to keep it at a consistent temperature).

Affinity Chromatography: A Review of Clinical Applications David S. Hage Affinity chromatography is a type of liquid chromatography that makes use of biological-like interactions for the separation and specific analysis of sample components. This review describes the basic principles of affinity chromatography and examines its use in the

### **A Review on High Performance Liquid Chromatography (HPLC)**

The term "Chromatography"™ covers those processes aimed at the separation of the various species of a mixture on the basis of their distribution characteristics between a stationary and a mobile phase.

### **Research and Reviews: Journal of Pharmaceutical Analysis**

"Chromatography is a separation process that is achieved by distributing the components of a mixture between two phases, a stationary phase and a mobile phase. Those components held preferentially in the stationary phase are retained longer in the system than those that are distributed selectively in the mobile phase. As a consequence, solutes are eluted from the system as local ...
