The Hildebrand solubility parameter ( $\delta$ ) provides a numerical estimate of the degree of interaction between materials, and can be a good indication of solubility, particularly for nonpolar materials such as many polymers.

This table is provided as an information service by Diversified Enterprises. This table highlights the surface tension and Hansen Solubility Parameters of a variety of solvents and other liquids.

Hansen solubility parameters were developed by Charles M. Hansen in his Ph.D thesis in 1967 as a way of predicting if one material will dissolve in another and form a solution. They are based on the idea that like dissolves like where one molecule is defined as being 'like' another if it bonds to itself in a similar way.

Carbonic acid (H<sub>2</sub>CO<sub>3</sub>). The hypothetical acid of carbon dioxide and water. Carbonic acid exists only in the form of its salts (carbonates), acid salts (hydrogen carbonates), amines (carbamic acid), and acid chlorides (carbonyl chloride).

The increasing prevalence of poorly soluble drugs in development provides notable risk of new products demonstrating low and erratic bioavailability with consequences for safety and efficacy, particularly for drugs delivered by the oral route of administration.

Copper sulfate is a sulfate salt of copper. It is a potent emetic and is used as an antidote for poisoning by phosphorus. It also can be used to prevent the growth of algae.

4.1.1. Closing of the mould. The first step in the steam-chest moulding cycle is the closing of the mould.  
4.1.2. Filling of the mould. Foamed beads are drawn by air pressure out of a container and blown into the mould by an injector, which usually functions according to the venturi-principle.
