Digital Signal Processing: Pearson New International

The most common processing approach in the time or space domain is enhancement of the input signal through a method called filtering. Digital filtering generally consists of some linear transformation of a number of surrounding samples around the current sample of the input or output signal.

@mujtaba: Yes, there is an advantage in using root raised cosine in receiver. Typical receivers have additive white gaussian noise and matched filtering helps one to maximize the signal to noise ratio in that scenario.

@Philips: I do not know much about the channel model for power line communications (except that the channel is a wire, ofcourse). However, for OFDM aspect may I point to couple of articles which I have written in the past.
