geological modeling and visualization. An interesting and useful feature of GE, Google Street View, can allow the GE users to view geological structure such as layers of rock masses at a field site. In this paper, we introduce a practical solution for building 3D geological models for rock masses based on the data acquired by use with GE. A real study case at Haut-Barr, France is presented

The Rock mass classification systems are also known as empirical methods for rock mass classification and considered as an integral part of the designing of underground structure, support systems, stability analysis and in determination of input parameters for numerical modeling within the rock mass environment. The empirical methods classify the rock masses into different categories having less or more similar geological and geotechnical properties on the basis of results obtained from rock ...

ABSTRACT: The Hoek-Brown failure criterion for rock masses is widely accepted and has been applied in a large number of projects around the world. While, in general, it has been found to be satisfactory, there are

some uncertainties and inaccuracies that have made the criterion inconvenient to apply and to incorporate into numerical models and limit equilibrium programs. In particular, the ...

To solve this problem, Xu et al. 24 proposed a numerical modeling method which involves two main steps: first, the rock masses in the research area are simplified as an equivalent jointed rock mass model; then, a back analysis method is used to invert the mechanical parameters of the model. This method did not consider the influence of joint spacing on joint mechanical parameters in the equivalent model. To improve the method in Xu et al.

Slice information when rock mass strength was linearly anisotropic. SLOPE/W can be used to model a variety of rock mass and rock joint shear strength material models. The formulas can easily be input into a spreadsheet and the data pasted into a shear-normal function.
